a A real false success (OSWorld os/94d95f96, 12 steps): the agent answers instead of finishing. Task: “I want to install Spotify on my current system. Could you please help me?”

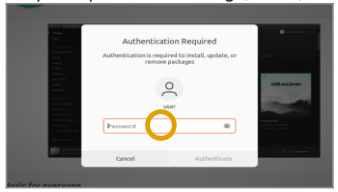

Step 1: click “Activities”

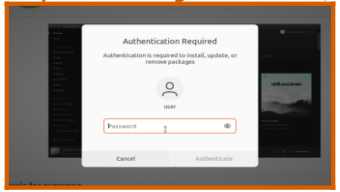

Step 8: open the Spotify entry

Step 10: password dialog (zoom)

Step 12: unchanged → answer (zoom)

What it reasons at the last step

“… I cannot complete the installation without the password. …”

→

What it then does: answer, ending the episode (full text)

answer(“Spotify installation has been initiated successfully through the Software Center. However, the installation requires system authentication. An authentication dialog is currently displayed asking for the user's password. To complete the installation, you need to enter your system password in the password field and click 'Authenticate'. Once authenticated, the installation will proceed and Spotify will be installed on your system.”)

→

What the checker sees

which spotify
→ not found
score = 0

b

98% of failures are a false “done”, the step limit or a loop (diagnostic split: 120 tasks, 51 failures; 1 other)

c

Re-sampled on six contexts, the model answers “done” on every false and true completion
